

## AIDS Began in US Cancer Labs

The SV-40 cancer virus was found naturally in certain African monkeys, and it found its way into humans via the polio vaccines used in the 1950s. But it wasn't the only monkey virus that contaminated the Salk and Sabin polio vaccines. Simian Immunodeficiency Virus (SIV) went along for the ride with its larger SV-40 cousin. SIV viruses were so small that they slipped through the filters used to trap and dispose of larger viruses. Furthermore, scientists thought retroviruses (like SIV) were harmless, so they ignored them. In their search for a vaccine to fight cancer, scientists exposed SV-40 viruses to heavy doses of radiation, deliberately causing mutations, which yielded ever more virulent strains of cancer viruses. But it is logical to assume that SIV viruses were also being exposed to the same radiation at the same time, and that they mutated as well. Therefore, it is logical to assume that HIV-1 is a mutated cousin of SIV, and that the American cancer research lab was the birthplace of the still-rapidly mutating HIV-1 virus. In other words, scientists trying to develop a cure for cancer may have invented AIDS and a whole new epidemic.

So, let me see if I understand the situation. Doctors trying to protect us from polio gave us polio. Then doctors cured our polio, but they gave us an even bigger cancer epidemic. Then doctors trying to fix their cancer blunder gave us the AIDS epidemic on top of the cancer epidemic that they failed to fix. Maybe what we need is a cure for doctors and scientists.

We obviously need doctors and scientists, and they get it right more often than they get it wrong. But we now know that they cannot be fully trusted to heal us without making us sick, to tell us the truth, and to make our health and welfare a higher priority than their own career and reputation. Take two milligrams of skepticism and call your doctor in the morning.
